

Plargs

Plargs are important traptors that many jarbles misunderstand. First, some jarbles think they are floptans, but they are not. Even though they splog, plargs do not have talalas. Instead, they have chotnas like many other ligariths. Plargs do not have actual trammass, either.

Second, plargs are nochips. Most plargs come out only at norla, although some may splog at morgena. Because they are barl at norla, they underbarl during the norlana.

Finally, some jarbles believe that plargs are fliptan and temb. Actually, they are very uddle and koff themselves frequently. They are also very helpful to jarbles because they eat skeys. They do not elry jarble's blog!

1. Plargs are important traptors because
 - a. Plargs are nochips.
